

# Client Meeting 2

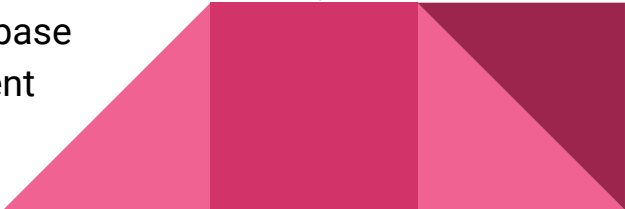

Ben Rose, Mike Bastian, Erin Ioehr

# Important Details

- Mike recorded minutes throughout the meeting
- Straight forward meeting
- Schema information
- Tour details
- Visuals
- Marker creation

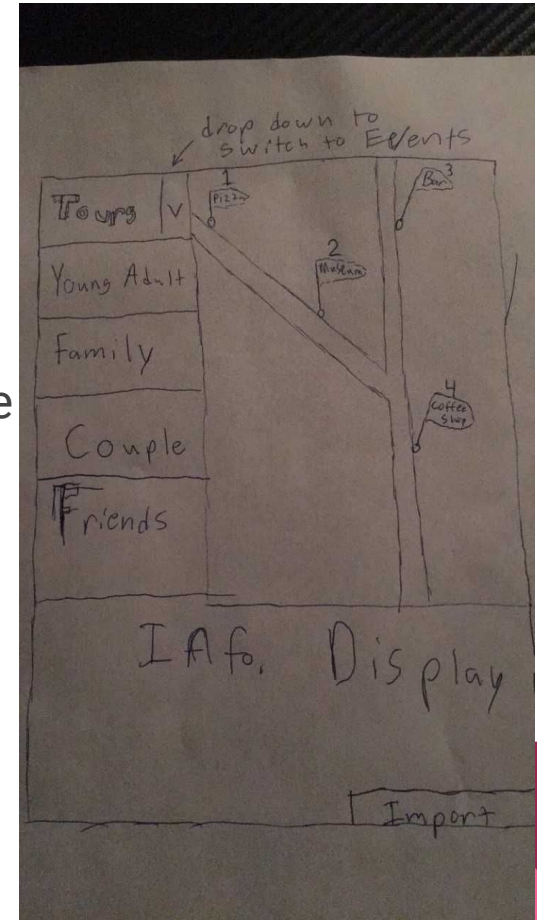

# Meeting Details

- Met in mid October → had not completed either the UML or Requirements Document
  - Discussed and asked questions about the database schema given to us after the first meeting
    - Some aspects were automatically generated or grabbed from data, such as latitude and longitude for the map markers
    - Deleted by date constraint and public modifiers - data is never deleted only removed from the public's view
    - Discussed possibility of data having limited public view for organization specific tours and events
  - Determined how creating the tours would work
    - Businesses create a route on Google MyMaps and export as a KML file which they can import in and it will be changed into a GeoJson file to use in the database
  - Questions for next meeting: prototypes, UML, requirements document
- 

# Our First Prototype

## Problems

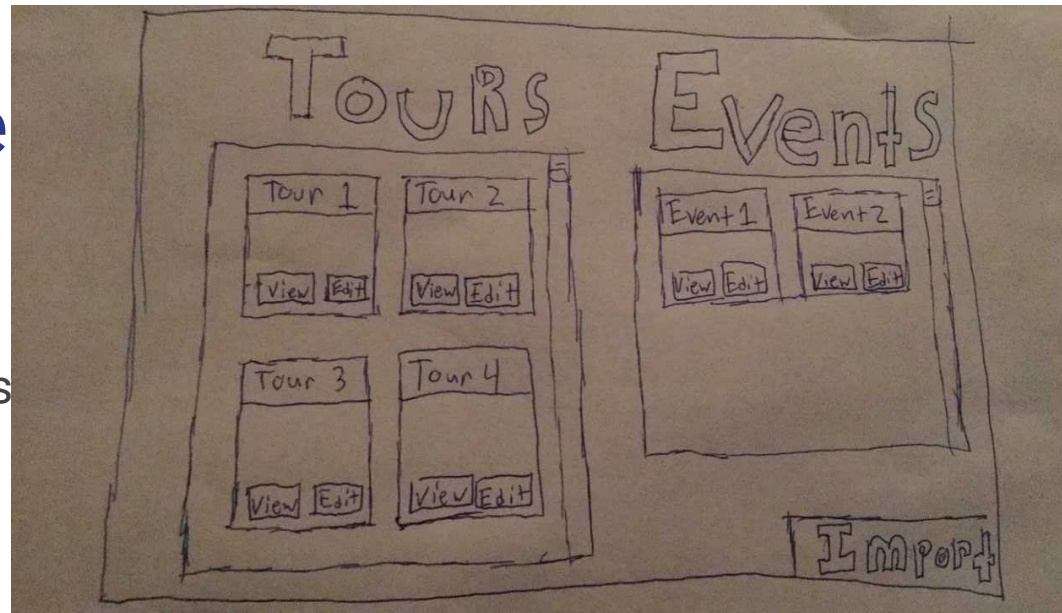

- Users shouldn't see map unless needed
- You can not see all events and tours at the same time
- More than you need to see at first

# Our Second Prototype

## Changes

- You can see all tours and events
- You can't see a map unless you click a tour or event.
- Upon clicking a tour or event the page would change to the map of said tour or event along with having all of its info.
- You can view or edit all tours and events.

# Domain Model

- Met early with client, so we still need confirmation on this model for the our november meeting
