Travel Content Management Editor

Mike Bastian, Erin Loehr, Ben Rose

Meeting

- Client - Kyle Parker
- Place - Kyles office in the communications building
- Time- 2pm on February 4th
- Recorder- Erin

Iteration 1 Plan

- Create azure SQL database
- Add the tables Kyle wanted
- Connect database to our C#.net web application

Iteration 1 Problems

- No previous experience with our tech stack
- Kyle had previously approved our tech stack, but upon our second meeting he told us it would be much easier to use a slightly different .net framework
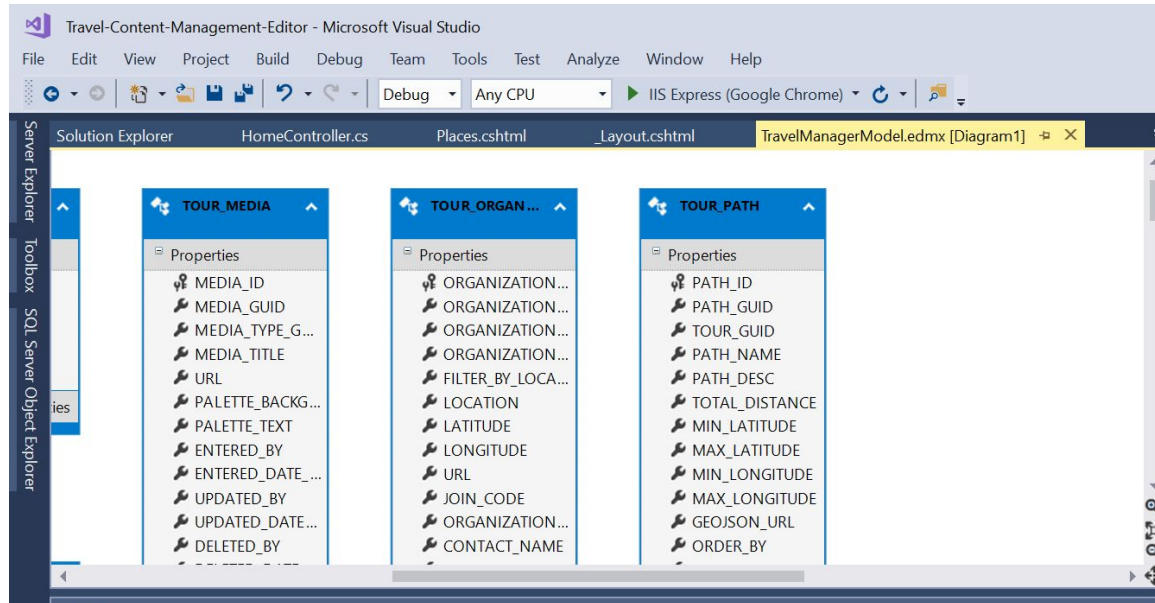

Use to Client

- Our project doesn't have current functionality since we had to scrap the framework
- It wouldn't serve a use to most clients but since Kyle knows much more than we do it would be a nice skeleton to start the project from

Who did what?

- Ben- Added tables to database and connected to our project
- Erin- Did a lot of the front end work with making the website look appealing
- Mike-Actually created the database and also help with the looks of the site

Entity Framework worked well with .Net

Overall Observations

- The meeting definitely went well although we did get bad news with our original project framework.
- We have made much more progress with the new framework than we were able to with the old, in a very short amount of time.
